

# SMART WASTE MANAGEMENT SYSTEM FOR METROPOLITAN CITIES

## 1.INTRODUCTION:

### OVERVIEW:

Smart waste management is the process of collecting, transporting, and disposing the waste material in an efficient manner with minimum impact on the environment. The use of smart bins or smart trashes for collection of waste material and garbage monitoring system helps waste management authorities to manage waste material effectively.

This project deals with the problem of Waste management in smart cities, where the garbage collection system is not optimized. This project enables the organizations to meet their needs of smart garbage management system. This system allows the user to know the fill level of each garbage bin in a locality or city at all time, to give a cost effective and time saving route to the truck drivers.

### PURPOSE:

This project IoT Garbage Monitoring system is a very innovative system which will help to keep the cities clean. This system monitors the garbage bins and informs about the level of garbage collected in the garbage bins via a web page.

## 2.LITERATURE SURVEY:

### EXISTING PROBLEM:

This project IoT Garbage Monitoring system is a very innovative system which will help to keep the cities clean. This system monitors the garbage bins and informs about the level of garbage collected in the garbage bins via a web page.

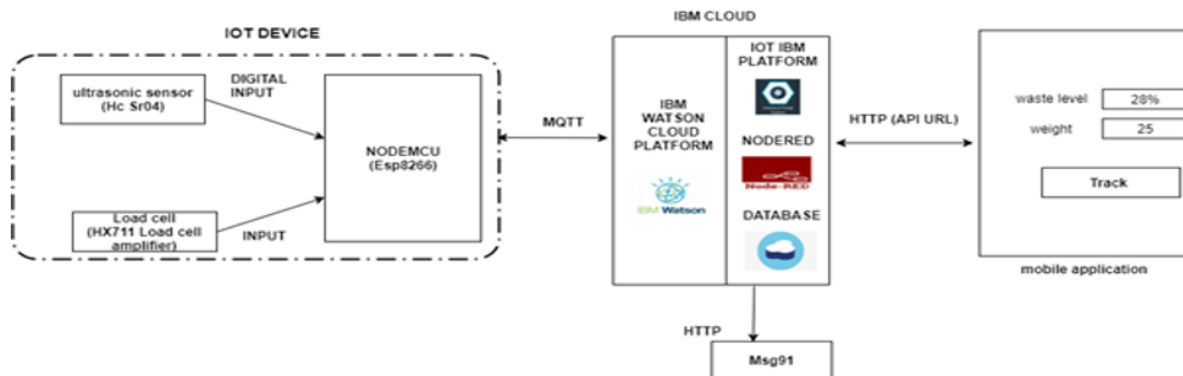

### PROPOSED SOLUTION:

This project IoT Garbage Monitoring system is a very innovative system which will help to keep the cities clean. This system monitors the garbage bins and

informs about the level of garbage collected in the garbage bins via a web page.

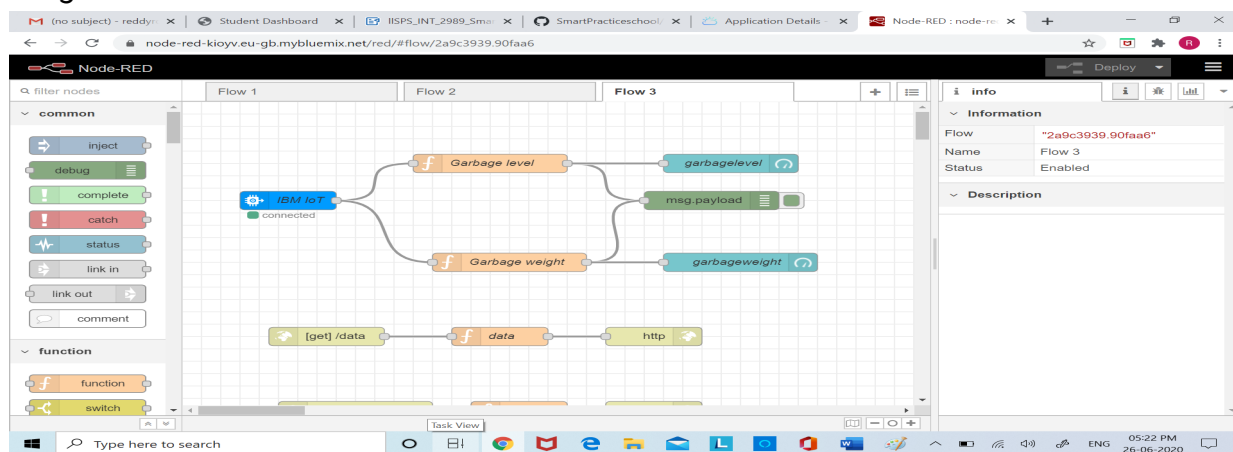

### 3.THEORITICAL ANALYSIS:

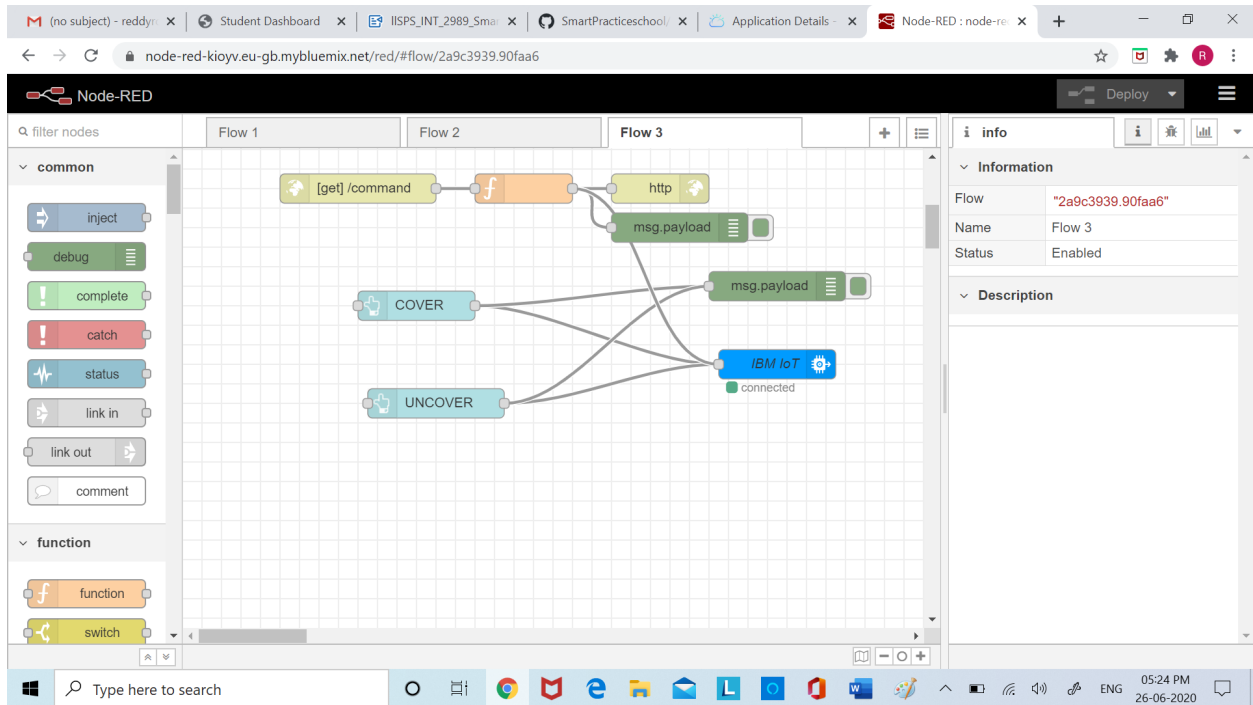

#### BLOCK DIAGRAM:

#### HARDWARE/SOFTWARE DESIGNING:

- Create a IBM account and in that create node red, cloudant, Watson IoT platform .
- After creating the above services go to IBM cloud dashboard, click on Cloud Foundry apps
- A new window appears where we need to NODE-RED app created before.
- After opening the node red service, take the nodes which are required for representing Garbage level, Garbage weight , debug nodes, function nodes etc.
- Connect the nodes to IBM IoT nodes to get the values to Garbage level, Garbage weight etc.

- After connecting all the nodes , Copy the Node Red URL till .net and paste in t he new tab by typing /ui along with the Node Red URL and press ENTER which will display the UI.

- Copy the URL in the Node Red flow till .net and paste in the new tab by a ppending

"/data" along with the URL and press Enter. Both the tank level and flow rate values will be displayed on the webpage

● As the values are sent to cloudant with the given file name

A screenshot of the Cloudant Databases dashboard. The page title is "Databases". Below the title, there is a table titled "Your Databases" with the following columns: "Name", "Size", "# of Docs", "Partitioned", and "Actions". The table contains four rows of data:

Name	Size	# of Docs	Partitioned	Actions
noderedkioyv	73.1 KB	4	No	[Icons for refresh, lock, and delete]
rohini123	0 bytes	0	No	[Icons for refresh, lock, and delete]
smartwastemanagement	79.1 KB	263	No	[Icons for refresh, lock, and delete]
wastemanagement	0 bytes	0	No	[Icons for refresh, lock, and delete]

At the bottom of the dashboard, there is a status bar that says "Showing 1-4 of 4 databases." and "Databases per page 20". The browser's tab bar shows several open tabs, including "Student Dasi...", "IISPS\_INT\_29...", "SmartPractic...", "Service Deta...", "Cloudant Da...", "Node-RED : ...", and "https://node...".

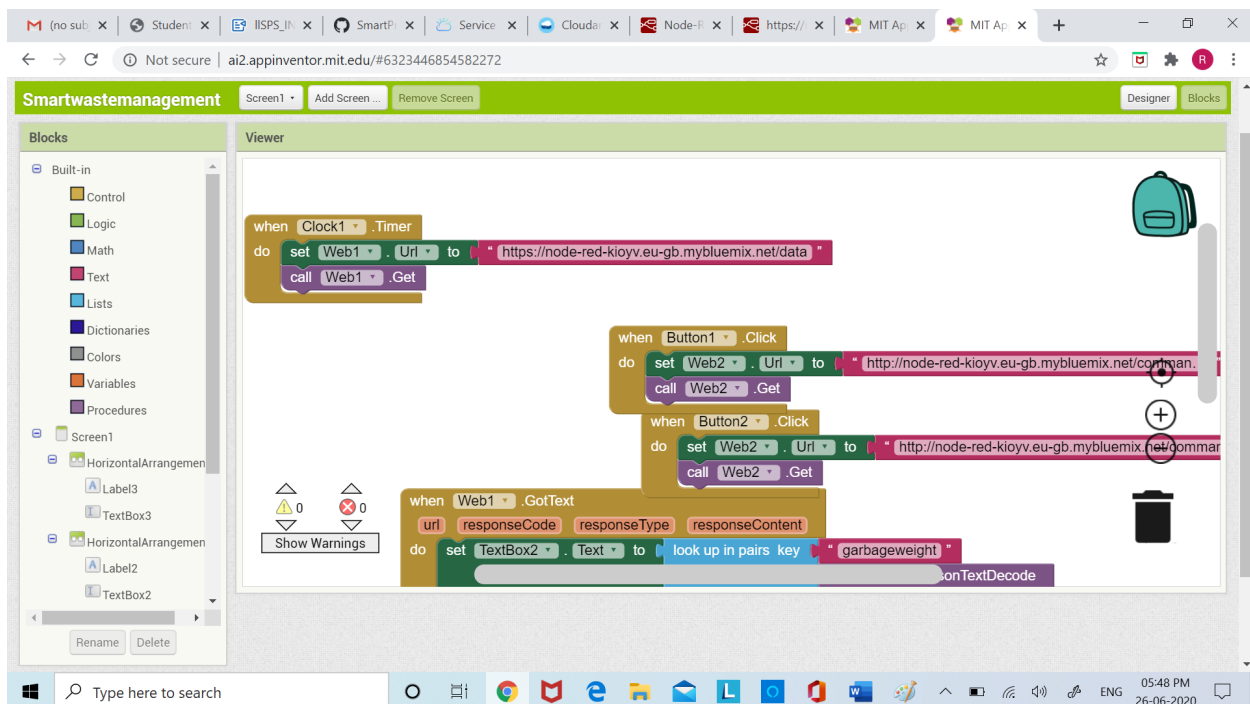

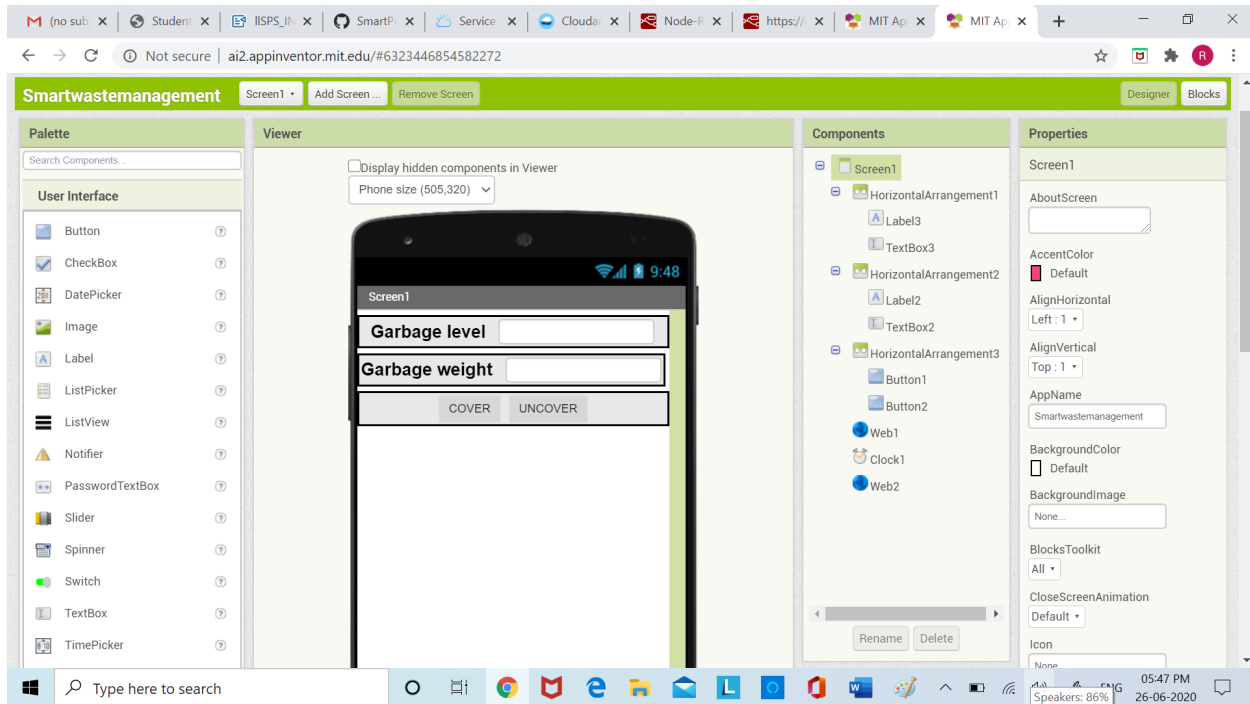

The screenshot shows the IBM Cloudant dashboard for a database named 'smartwastemanag...'. The interface includes a sidebar with navigation options like 'All Documents', 'Query', 'Permissions', 'Changes', and 'Design Documents'. The main area displays a table view of documents. The table has the following columns: '\_id', 'Garbage Level', 'Garbage Weight', 'Garbagelevel', and 'Garbageweight'. There are 6 documents listed, with IDs starting with '2589dc956e23e...' and '2d4131af56cf70...'. The 'Garbage Level' and 'Garbage Weight' columns contain values like 2, 1, and two. The 'Garbagelevel' and 'Garbageweight' columns contain values like 73 and 70. At the bottom, it says 'Showing 5 of 6 columns.' and 'Showing document 1 - 20. Documents per page: 20'.

## - The data is stored in the json format

The screenshot shows the IBM Cloudant dashboard for the same database, but now displaying the JSON format of the documents. The interface is similar to the previous screenshot, but the main area shows the raw JSON data for two documents. The first document has an ID of '2589dc956e23eb0effb2010973c492cb' and contains a nested object with fields 'id', 'key', 'value', and 'rev'. The second document has an ID of '2d4131af56cf7056bbff58df8605e451' and contains a similar nested object. At the bottom, it says 'Showing document 1 - 20. Documents per page: 20'.

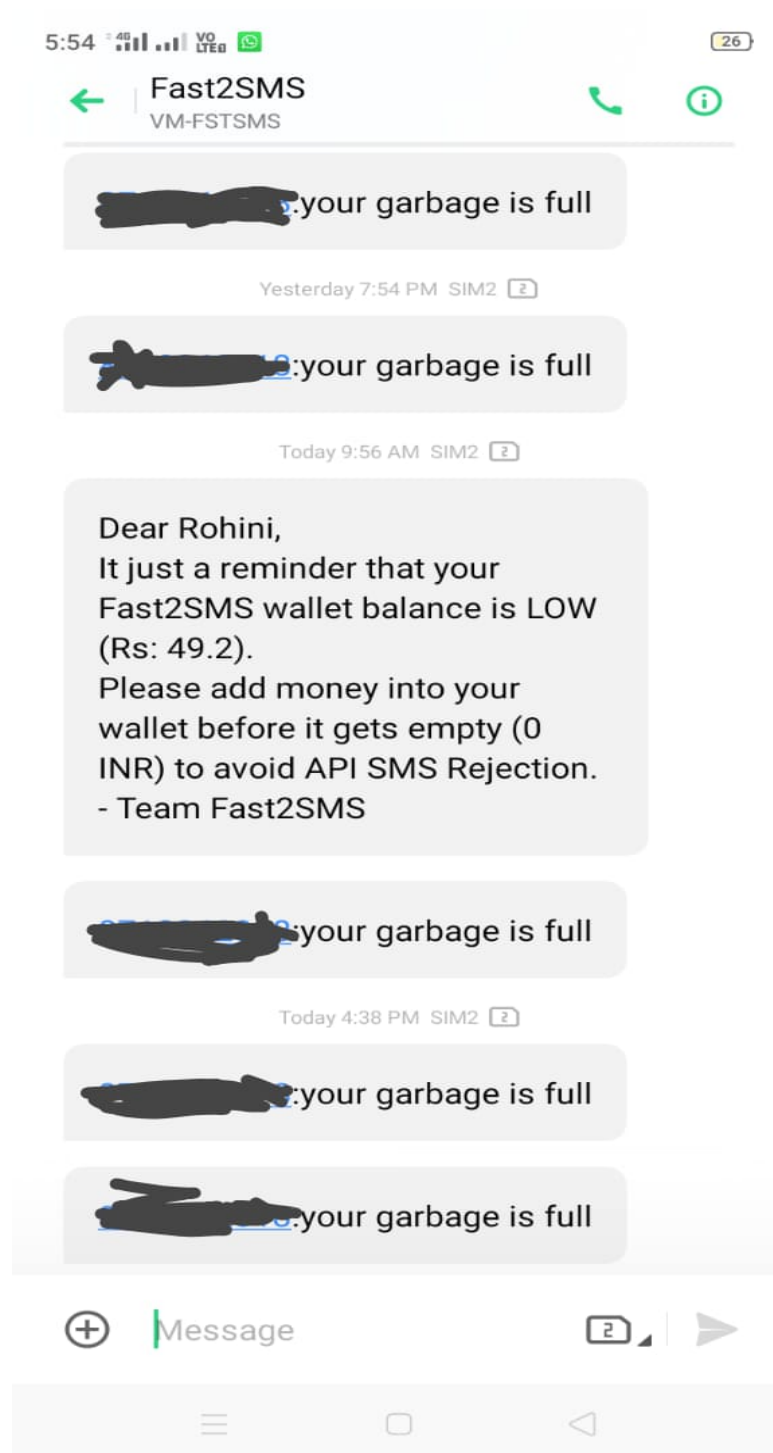

- 
- n
- Type MIT App inventor in google search and press Enter, select the first link in the search engine
- Click on the first link you will be redirected to MIT App Inventor dashboard.

- Click on Create Apps! It will redirect to the Gmail login page. Through Gmail account by typing your Username and Password, you can log in to the MIT App flow editor .
- Agree with terms and conditions. By agreeing with the terms and conditions you will be redirected to the Dashboard and click on Start new project.

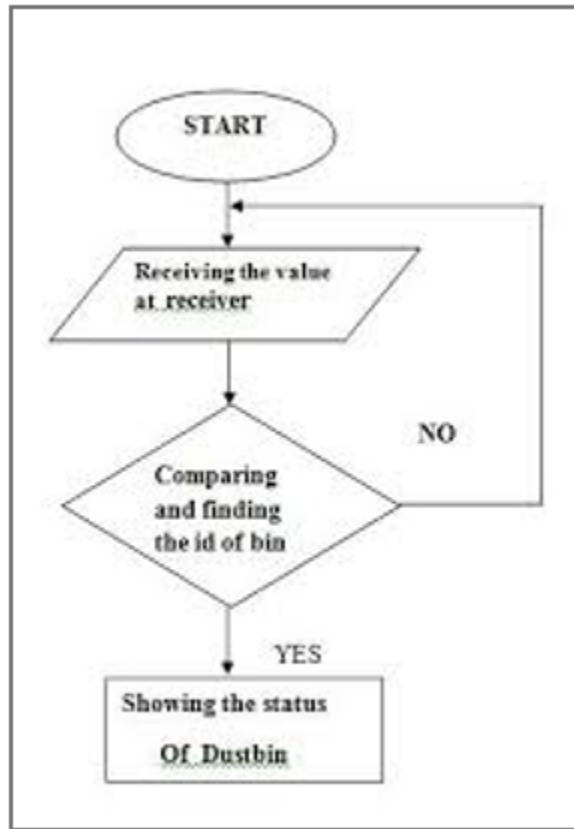

triggered when to empty the bin and also alert is sent when ever level of garbage is full.

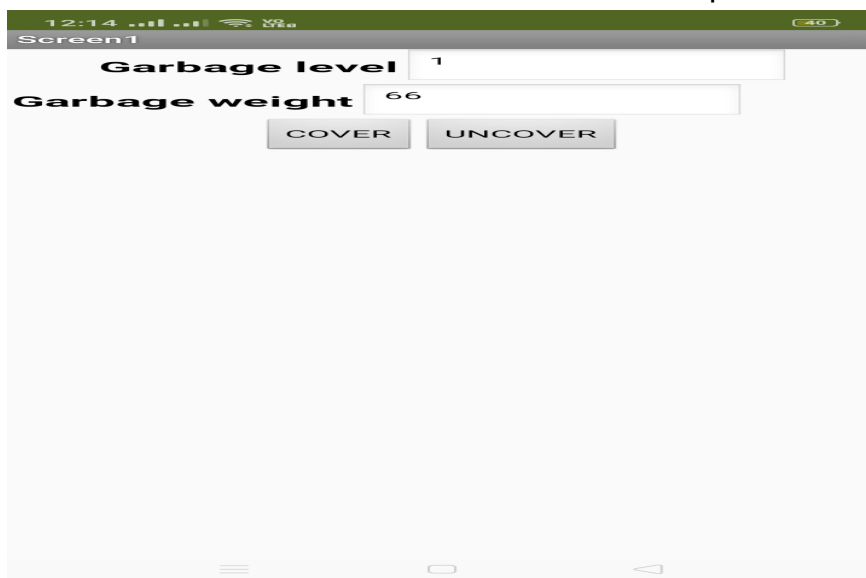

## 5.FLOW CHART:

## 6.RESULT:

Once see the details of waste and it alerts the person.

## **7.ADVANTAGES:**

- 1 . Waste Level detection inside the garbage bins. Transmission of the information wirelessly to concerned officials .
2. System can be accessed anytime and from anywhere.
3. Real-time data transmission and access.
4. Avoids the overflows of garbage bins.
5. This project can only be used by municipal authorities or other private firms to tackle the current problem of urban waste collection.
- 6.Improves Environment quality-Fewer smells-Cleaner cities.
7. This system has no individual use, but can be used by a city, state or a country.
8. Using this system, waste collection would become efficient and also reduction in transportation costs can be witnessed

## **DISADVANTAGES:**

- 1.System requires more number of waste bins for separate waste collection as per population in the city. This results into high initial cost due to expensive smart dustbins compare to other methods.
- 2.Sensor nodes used in the dustbins have limited memory size.
- 3 . Wireless technologies used in the system such as zigbee and wifi have shorter range and lower data speed. In RFID based systems, RFID tags are affected by surrounding metal objects ( if any).
- 4 .Training It reduces man power requirements which results into increase in unemployments for unskilled people

## **8.APPLICATIONS:**

- 1 . Waste Level detection inside the garbage bins. Transmission of the information wirelessly to concerned officials .
2. System can be accessed anytime and from anywhere.
3. Real-time data transmission and access.
4. Avoids the overflows of garbage bins.
5. This project can only be used by municipal authorities or other private firms to tackle the current problem of urban waste collection.
- 6.Improves Environment quality-Fewer smells-Cleaner cities.
7. This system has no individual use, but can be used by a city, state or a country.
8. Using this system, waste collection would become efficient and also reduction in transportation costs can be witnessed.

## 9.CONCLUSION:

Monitoring the fullness of bins through the use of sensors, it is possible to achieve a more efficient system than the current existing. Our idea of "Smart waste management system", mainly concentrates on Monitoring the waste management, providing a smart technology for waste system, avoiding human intervention, reducing human time and effort and which results in healthy and waste ridden environment. The proposed idea can be implemented for smart cities where the residents would be busy enough with their hectic schedule and wouldn't have enough time for managing waste. The bins can be implemented in a city if desired where there would be a large bin that can have the capacity to accumulate the waste of solid type for a single apartment.

## 10.FUTURE SCOPE:

There are several future works and improvements for the proposed system

- 1 . Change the system of user's authentication and atomic lock of bins which would help in securing the bin from any kind of damage or theft.
2. Concept of green-points that would encourage the involvement of the residents or the end users making the idea successful and helping to achieve joined efforts for the waste management and hence fulfilling the idea of Swachch Bharath.
3. Having a case study or data analytics on the type and times the waste is collected on the type of days or season making the bin filling predictable and removing the dependency on electronic components and fixing the coordinates.
4. Improving graphical interfaces for the Server and complete Android applications has possibility of extending the system adding other use cases and applications for smart cities.
5. Moreover, the proposed solution is flexible and decoupled with respect to the determination of optimal number of bins and vehicles or to the algorithm that define the best route for vehicles.
